EXECUTIVE DASHBOARD OVERVIEW

Dashboard Highlights (June 2026)

- Total Inventory Value: ₦13.07 Million
- On-Time Delivery Rate: 100%
- Inventory Turnover: 3.6x
- Low Stock Items: 0
- Average Lead Time: 3.4 Days

Page 3: Project Summary & Technical Implementation

Project Objective

To design and develop a complete **end-to-end Supply Chain & Inventory Management System** using **MySQL** as the backend and **Microsoft Power BI** for advanced analytics and visualization.

Key Achievements

- Designed a robust relational database (supply_chain_db) with proper normalization and relationships across Products, Inventory, Suppliers, Warehouses, Shipments, etc.
- Successfully established a stable connection between MySQL and Power BI.
- Built a clean, modern, and interactive dashboard with professional UI/UX.
- Implemented advanced DAX measures for KPIs, trends, alerts, and time intelligence.
- Created a **fully refreshable** solution – any new data entered in MySQL reflects instantly after refresh in Power BI.

Technical Stack

- Database: MySQL 8.0+
- Data Transformation: Power Query (Merges & Cleansing)
- Analytics Engine: DAX
- Visualization Tool: Power BI Desktop

Page 4: Key Insights & Business Impact

Major Findings from the Dashboard

- 1. **Inventory Health** Strong control over stock levels with currently **zero low-stock items**. Groceries dominate the inventory value.
- 2. **Operational Efficiency** Outstanding performance with **100% On-Time Delivery** and an average lead time of just **3.4 days**.
- 3. **Trends & Analysis** Clear visibility into purchasing vs sales movement and top-performing products, enabling better inventory planning and decision-making.

Visual Analysis

- **Stock by Category** (Bar Chart)
- **Shipment Status** (Donut Chart)
- **Top 10 Products by Stock Value** (Bar Chart)
- **Purchases vs Sales Trend** (Combo Chart)
- **Reorder Alert** (Table)

Business Impact

This dashboard transforms raw transactional data from MySQL into clear, actionable business intelligence. It empowers Procurement, Warehouse, and Management teams to make faster and smarter decisions.

Page 5: Conclusion & Recommendations

Conclusion

The Supply Chain & Inventory Management Dashboard successfully demonstrates strong technical capability in database design, data modeling, DAX development, and professional dashboard creation. Built from scratch using **MySQL** → **Power BI**, it delivers real-time visibility and practical business value.

Recommendations & Next Steps

1. Deploy the dashboard to **Power BI Service** with scheduled refresh via Data Gateway.
2. Add more historical data (6–12 months) for deeper trend analysis and forecasting.
3. Develop **Phase 2**: Supplier Performance Dashboard + Demand Forecasting.
4. Implement Row-Level Security for multi-user access.
5. Optimize for mobile devices for field team usage.

Final Note

The system is production-ready and fully functional.
